- Engin Lead: Kumar Pahlajani

Major Feature Overview

Modular supervisor experience that allows admins to create unique supervisor views via Lightning App Builder (LAB) flexipages. Admins can drag, drop, and customize LAB components powered by real-time omni-channel data alongside any other LAB components available to them, Tableau Next for example.

This transforms a rigid, one-size-fits-all product into a flexible, extensible platform. Directly addressing very common customer requests and bringing our offering to competitive parity, meeting a standard expectation in the contact center industry. By leveraging the familiar Lightning App Builder, we are empowering customers to create a unique-to-them unified operating systems where Workforce Engagement (WEM) insights, Tableau Next analytics fed by Data Cloud, and customer-built Industry Flexicards can coexist seamlessly alongside our realtime Omni Supervisor Metrics.

Customer Pain Point

Problem Statement

The current Omni Supervisor interface is a "one-size-fits-all" experience that lacks UI extensibility. Regardless of industry, team size, or operational complexity, every supervisor is locked into a hard-coded wallboard of eight static metric cards and similar fixed functional tabs (Service Rep, In-Progress, Skills Backlog, Queues Backlog).

This rigid architecture forces customers to adapt their business processes to Salesforce's constraints, rather than the platform empowering their workflows.

Business Impact

The inability to customize supervisor views results in a competitive gap ([Genesys](#) example) and lots of customer frustration ([VOC1](#), [VOC2](#), [VOC3](#), [VOC4](#)) as **customers are forced to deal with**

- **Context-Switching:** Supervisors must toggle between Omni Supervisor tabs and Salesforce Reports or Tableau dashboards to get a complete picture as there is no way to see non-omni data (such as CSI sentiment) side-by-side with real-time omni data. As noted by **WarnerMedia**, they cannot add the daily aggregates (like total calls answered or abandoned) that live in their reports to the Command Center for Service view, forcing a fragmented workflow.
- **Static, "One-Size-Fits-All" approach:** Within the wallboard, customers are locked into 8 pre-defined metric cards. **21 major accounts** have specifically requested the

ability to pick and choose their own KPIs. Similarly, there is no way to pick and choose what columns are shown in the Service Rep, In-Progress, and Backlog tabs. **Jaguar Land Rover** has explicitly called this out as a painful issue during their onboarding process.

- **Visual Limitations:** Large-scale operations like **Charles Schwab** and **Doctolib** are forced to consume complex queue data in tabular lists. They lack the ability to embed visual charts or trend lines, which are essential for high-speed decision-making during peak volumes.
- **Stifled Partner Extensibility:** Internal and external partner teams (such as WEM, Customer Signals) cannot surface their innovations directly within the supervisor's primary workspace, limiting the overall value of the Service Cloud ecosystem.

Impact on Future Product Delivery

With native voice and WEM development, this is going to become a bigger challenge for Service Cloud deals as customers expect to surface relevant data to their supervisors (such as num of calls transferred in the last hour and real-time schedule adherence). With more data to show, customers expect to be in control of how this real-time data is organized.

High Level Solution

To transform Omni Supervisor from a static tool into a flexible platform, we will leverage the Command Center Page Type (to be delivered by the Salesforce Command Center team) within the Lightning App Builder (LAB). And to provide the omni data within this new page, we will break down the existing monolithic interface into modular Lightning Web Components (LWCs).

- **Lightning App Builder Integration:** By adopting the Command Center flexipage, we provide customers with a familiar "drag-and-drop" configuration experience. This unlocks the ability to mix native Omni Supervisor data with any standard or custom LWC.
- **De-coupling the Interface:** We will "componentize" the current supervisor experience, delivering real-time LWCs powered by Omni-Channel real-time data:
 - **Metric Card:** A configurable widget to display contact center KPIs.
 - **Service Reps:** A real-time view of their supervisor's team, their capacity, work, etc.
 - **In-Progress Work:** Direct visibility into active customer interactions.
 - **Backlog:** Real-time monitoring of queue volume and wait times.
- **Default View:** We will deliver a default Command Center for Service layout populated with omni, WFM, and CSI LWCs ensuring customers have a functional

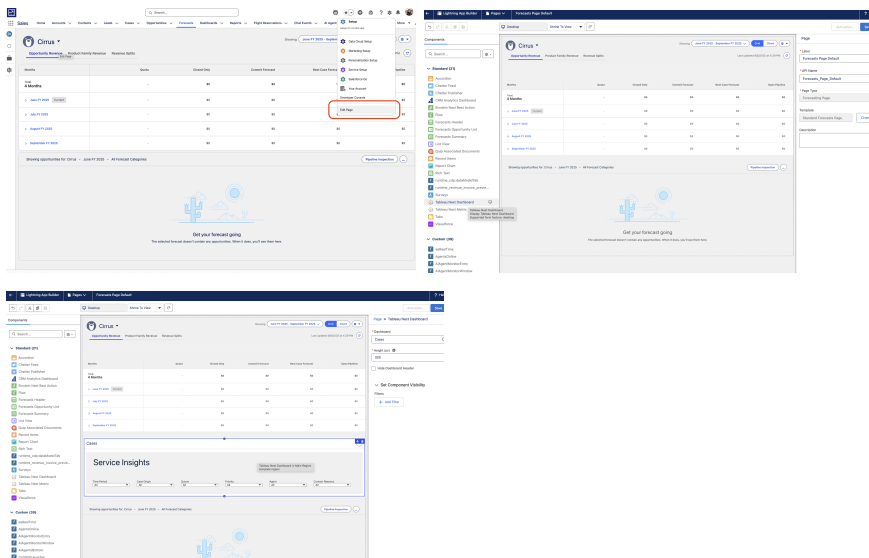

baseline at product adoption. From this default, admins can immediately begin adding any other available LWCs.

For acceptance criteria please see the “[Acceptance Criteria and User Stories](#)” tab contents:

Page & Component Access

Today's Pain Point

Today's supervisor experience does not have a license/perm check which results in a frustrating customer experience where users can **open** the Command Center for Service page but unless the user license check `userCanUseOmni = true` user config, queues, statuses, skills, public groups, supervisor configs are not loaded. So the loaded page is virtually useless.

Solution

1. Enhanced Omni (`orghasOmni`): admin has access to
 - a. Omni metrics within LiveCards
 - b. Omni LAB components
 - i. In-Progress Work
 - ii. Service Reps
 - iii. Backlog
 - c. Command Center for Service OOTB flexipage
2. Public Group: activate page in LAB for a Public Group that a supervisor is in

3. Users NOT in Public Group should not be able to access Command Center for Service URL if shared by a user who is part of the Public Group
4. Internal user license check: `userCanUseOmni` must be TRUE (have Service Cloud, DE, BYO, MIAW, Voice (any) license) to allow the supervisor to see Command Center for Service navigation item.
5. When `userCanUseOmni` `!= TRUE` , options:
 - a. Ideally: Load page with error saying license is needed
 - b. Alt: Hide page from nav items entirely

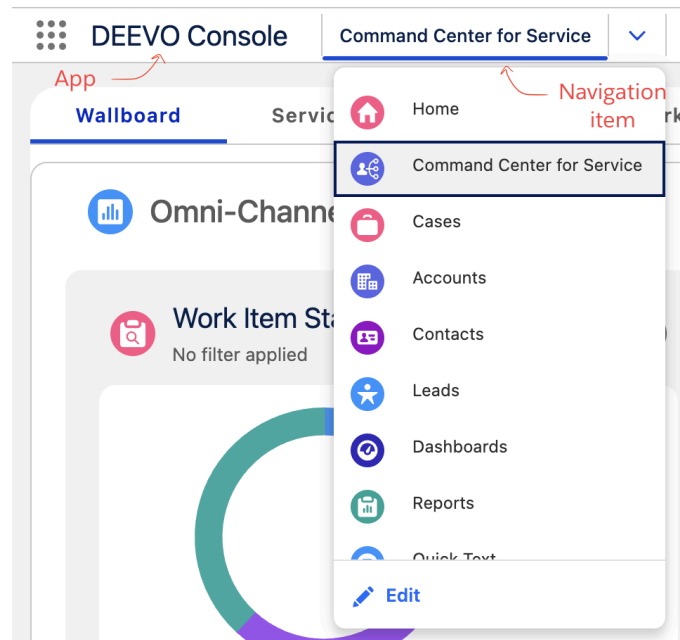

[262 patch] Command Center Page
Type

[262 patch] Command Center Page Type

In 262, the Salesforce Command Center team is delivering a new LAB page type: Command Center. This allows users to 1) create a flexipage that can be customized using the available components and 2) connect it to a navigation item within an app.

Page Type Requirements

- **Page Creation:** In Setup > Lightning App Builder, Admin can create a new LAB page using the Command Center page type.
- **Navigation Item:**
 - Existing Nav: Admin can select which existing navigation item the new page should show up in.
 - New Nav: Admin can choose to select 'new' and enter the navigation item label.
- **Page Template:** Admin can select to use a grid.
- **Activation/Visibility:**
 - **App:** Admin can assign the new page to other apps beyond the Command Center (such as Service Console, Sales Console, etc).
 - **User:** Admin can select which Public Groups (group of users) can see the created page.
 - **Contextual Page Overwrite:** Admins can map multiple Flexipage Variants to a single Host Tab (Command Center for Service in our scenario), to automatically override the default experience and deliver the most relevant layout to a specific user context.
 - For example, Sasha and Derek both see a "Command Center for Service" navigation item but we see different components within it because we are assigned to different flexipage variants mapped to the same host tab.

More on Page per Public Group Assignment

Supervisor Configurations can be assigned per User and Profile. Profile is not a commonly used option.

With the Command Center page type assigned per Public Group, customers will need to create Public Group(s) for their supervisors. While this adds a setup step, it allows customers to apply supervisor pages across supervisor configurations. For example: admin may have USA supervisor config and EU supervisor config. Each config has different queues, skills, and reps selected as relevant for each region. Admin can create ONE Public Group with all USA and EU supervisors and share the Command Center for Service with that Public Group. They may also create two separate Public Groups, one for each region, and apply the Command Center for Service page to both Public Groups.

Public Group Scenarios Explained

Basic Set Up: ONE group

- Supervisor Public Group: ONE Public Group with all supervisors
- Command Center for Service: ONE Command Center for Service page created & selected as visible to the ONE Public Group.
- Supervisor Configs: filters what is shown in Command Center for Service
 - USA supervisor config with USA-specific reps, queues, and skills selected
 - EU supervisor config with EU-specific reps, queues, and skills selected

Basic Set Up: MULTIPLE groups

- Supervisor Public Groups:
 - USA Supervisors
 - EU Supervisors
- Command Center for Service:
 - ONE Command Center for Service page can be created and selected as visible to the BOTH Public Groups.
 - If unique page experiences are desired per group, TWO Command Centers can be created and assigned per group:
 - USA Command Center Page
 - EU Command Center Page
- Supervisor Configs:
 - USA supervisor config with USA-specific reps, queues, and skills selected
 - EU supervisor config with EU-specific reps, queues, and skills selected

Scenario A: New Supervisor Joins US Team

- Admin must add new user to the USA supervisor public group
 - Automatically, new supervisor can see the USA Command Center Page (as per the basic set up above)
- Admin must add supervisor to the USA supervisor config, filtering their Command Center Page

Scenario B: New Supervisor Area is Added

There is now a need for one supervisor to monitor USA WEST only.

- Admin must create new supervisor config (USA WEST Supervisor config) to select only the USA WEST reps as visible
- Supervisor is still part of the USA Supervisors Public Group so they can still see the USA Command Center Page filtered by USA WEST Supervisor config data.

Scenario C: Page Customization is Desired

The USA WEST Supervisor wants to have a unique wallboard within their Command Center.

- Admin must create a new single-user Public Group: USA-WEST Public Group
- Admin must clone USA Command Center Page & make edits to create a new USA WEST Command Center Page
 - Admin must assign the page to the USA-WEST Public Group

[262 patch] Command Center for
Service Flexipage

[262 patch] Command Center for Service Flexipage

The Command Center for Service (CCfS) is a filebased flexipage created on top of the Command Center page type. It is populated with LWCs ensuring customers have a functional baseline at product adoption.

Page Requirements

- **Discovery:** In Setup > Lightning App Builder, admin can see a new page called “Command Center for Service”
- **Adoption:** Admin must edit the “Command Center for Service” page to customize the components within it.

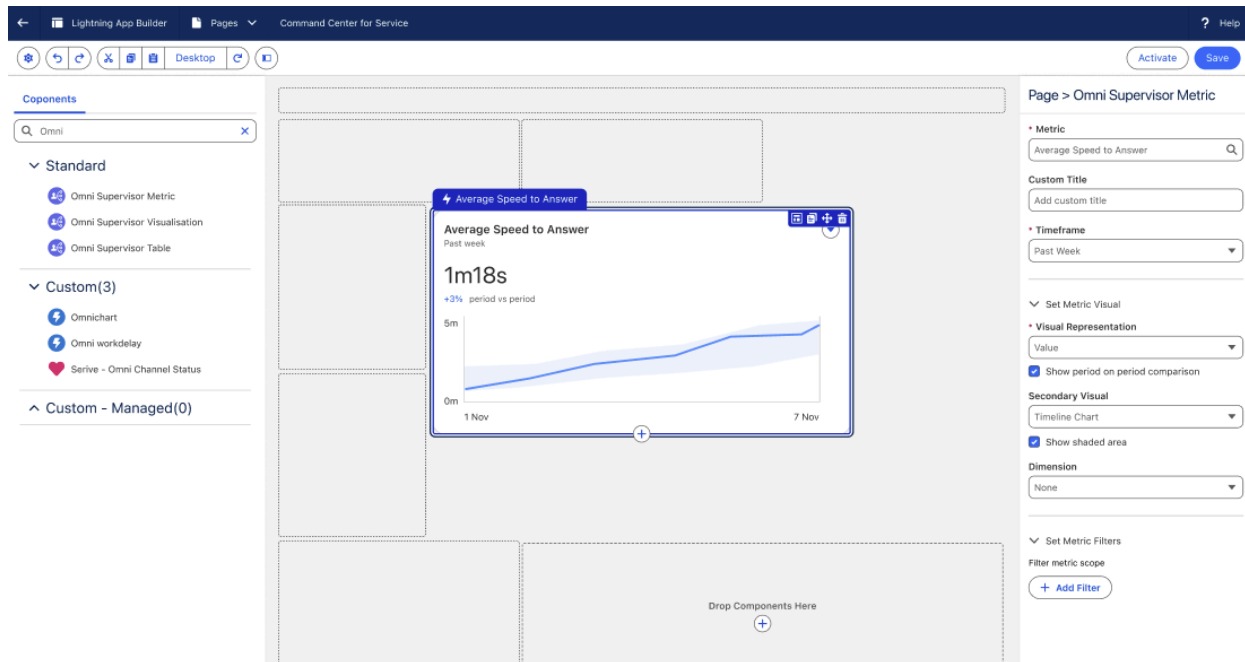

Page Contents

“Command Center for Service” flexipage aims to provide customers with a comprehensive supervisor experience mimicking today’s Omni Supervisor view.

[262 patch] Metric Card (Wallboard Rewrite)

[262 patch] Metric Card (Wallboard Rewrite)

The Metric Card is a versatile LAB component that provides key metrics and/or visuals for supervisors, allowing them to monitor team performance at a glance.

Admin Config

When editing a page via LAB, in the Component list view, admins see a new Omni Metric Card component.

After dropping the component onto the page, on the right hand side, the admin needs to configure what data should be shown on in the component:

Metric

Admin can select from a list of [omni metrics](#) that can power the card.

- Note: **How we calculate waiting metrics (Total Waiting, Longest Wait Time, and Average Wait Time) must change** as with the new ability to schedule work to be routed in the future, it'll show up as 'waiting' on the dashboard when it's actually just waiting to be routed - different from waiting to be 'assigned'.

Title

Admin can input a custom name for the card. By default, metric names are used.

Timeframe

Admin can select the window of time that is used to calculate the metric. The selected timeframe is clearly stated within the card.

- [P0] Real-time
- [P2] 5m
- [P0] 15m for “average” metrics:
 - Average Handle Time
 - Average Active Work Time
 - Average After Conversation Work Time
 - Average Speed to Answer
- [P0] 1h for “average” metrics:
 - Average Handle Time
 - Average Active Work Time
 - Average After Conversation Work Time
 - Average Speed to Answer
- [P2] 8h
- [P1] 24h

Visualization

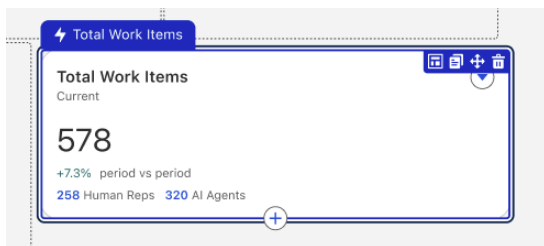

Admin can select how the data is shown. By default, only a Value is shown.

Value

A single number that represents the metric total.

Selecting a Value also allows admin to add

- [P2] Period over period % change
- [P0] Show human and AI agent values; This is NOT relevant for all metrics; please see column I [here](#) for the applicable metrics.

Time Series

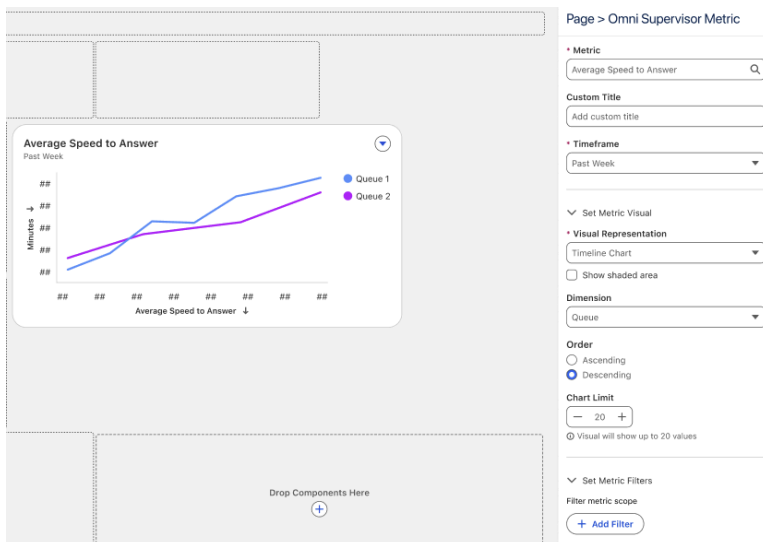

Time Series shows how the metric has progressed over the selected period of time.

Time series is P0 only for “average” metrics:

- Average Handle Time
- Average Active Work Time
- Average After Conversation Work Time
- Average Speed to Answer

Selecting a Time Series chart results in additional config options popping up on right hand side:

- **[P0] Dimension:** Admin can choose to show multiple time series lines within the card. See prioritized dimensions per metric [here](#)).
 - **Order:** by default, order is descending.
 - [P2] Admins can choose a descending or ascending order
 - **Category limit:**
 - If num of categories within a dimension is hard coded (such as work item statuses) then each category is shown as an individual line
 - If num of categories within a dimension is customizable by a admins (such as rep presence statuses) then up to 10 categories are shown.
 - [P2] Admins can pick and choose which categories are shown.

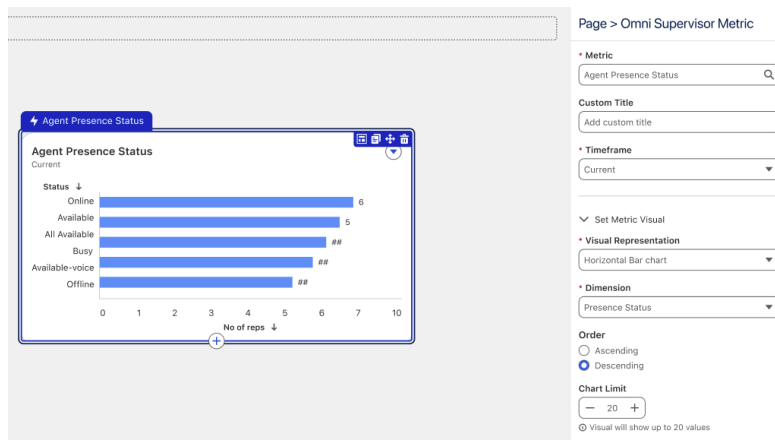

Bar & Donut Charts

Bar and donut charts allow supervisors to visualize and compare metrics across multiple categories.

Selecting a bar or donut chart results in additional config options popping up on right hand side:

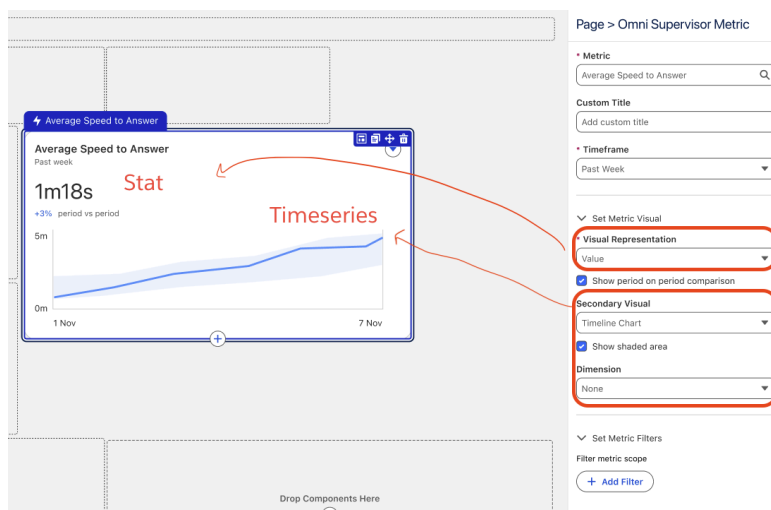

- **[P0] Dimension:** Admin must select what category drives what each bar or pie piece represents. See prioritized dimensions per metric [here](#)).
 - **Order:** by default, order is descending.

- [P2] Admins can choose a descending or ascending order.
- **Category limit:**
 - If num of categories within a dimension is hard coded (such as work item statuses) then each category is shown as an individual bar or pie piece
 - If num of categories within a dimension is customizable by a admins (such as rep presence statuses) then up to 10 categories are shown.
 - [P2] Admins can pick and choose which categories are shown.

Secondary Visual

Admin can add a time series, bar, or donut chart below a stat by selecting a 'Secondary Visual.'

Supervisor Experience

Supervisors see the cards created and dropped into their pages by the admin. Supervisors can then adjust the visualizations and apply filters.

Visualization

[P1] Supervisors can change the visualization option selected by the admin.

Dimensions

[P1] Supervisors can adjust what dimension drives the timeseries, bar, or donut chart so that they can compare the metric by categories relevant to them on the fly. For example, as a supervisor, I may want to see Avg Handle Time by queues, and then switch to see Avg Handle Time by reps to see if the high handle times are due to a set of complex queues or due to specific service reps working at a slower than average pace.

See prioritized dimensions per metric [here](#).

Filtering

[P0] Options visible to supervisors in each of the filtering categories are driven based on the selections in their Supervisor Config.

[P0] All filters are sticky / saved until reset by the user (*the lack of sticky filters is a long standing customer pain point with the current experience*).

[P0] Default: If no filter is applied, the cards visualize data from all queues, skills, and service reps that are selected within the supervisor config.

Supervisors can select one or more options from ONE of the below categories.

- [P0] Queue(s)
 - Selecting one queue filters the cards to only represent work in that queue
 - Selecting multiple queues results in data being calculated using BOTH selections. Example: If Billing and Returns queues are selected, Avg Wait Time would be calculated using work in Billing *and* Returns queues.
 - If a queues filter is selected, any applied skills filter is cleared.
- [P0] Skill(s)
 - Using the skill filter requires the selection of either
 - One or more selected skills: metric represents work with at least the selected skill
 - All selected skills: metric represents work with ONLY the selected skill
 - If a skills filter is selected, any applied queues filter is cleared.

- [P0] Channel(s): supervisor can filter the metric by available channels
 - Selecting one channel filters the metric to only the conversations with the selected channel
 - Selecting multiple channels results in data being calculated using BOTH selections. Example: If messaging and phone channels are selected with the inclusion option, Avg Wait Time would be calculated using phone and messaging wait times.
- [P0] Teams:
 - PRD: 262-264 Agentic Supervisor: Modular Command Center for Service
- [P1] Service rep(s)
 - Selecting one rep filters the metric to only represent work owned by that rep
 - Selecting multiple service reps results in data being calculated using BOTH selections. Example: If Derek and Kathleen are selected with the inclusion option, Avg Wait Time would be calculated using work owned by Derek or Kathleen queues.

Not all filter options are relevant for all metrics. See relevant filters per metric [here](#).

Clearing Supervisor Selections

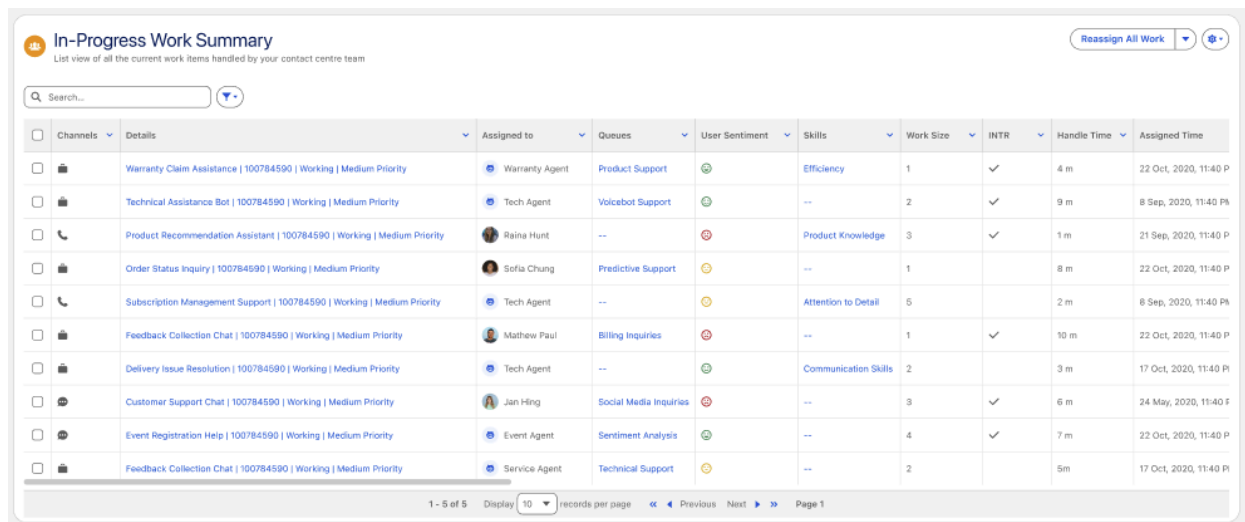

[P0] Supervisors must be able to clear their selections to reset the card back to the admin's configuration.

[262 patch] In-Progress Work Component

[262 patch] In-Progress Work Component

The In-Progress Work component shows supervisors a list view of all work that their service reps and AI-agents are currently owning, allowing them to understand current handle times and identify customer inquiries that may need their attention and/or intervention.

*List of work should respect any Sharing Rules configured and filter out work that has any non-accessible fields to the user.

The screenshot shows the 'In-Progress Work Summary' interface. At the top, there's a title 'In-Progress Work Summary' and a subtitle 'List view of all the current work items handled by your contact centre team'. A 'Reassign All Work' button is in the top right. Below the title is a search bar. The main area is a table with columns: Channels, Details, Assigned to, Queues, User Sentiment, Skills, Work Size, INTR, Handle Time, and Assigned Time. The table lists 10 work items with details like 'Warranty Claim Assistance', 'Technical Assistance Bot', 'Product Recommendation Assistant', etc. At the bottom, there's a pagination bar showing '1 - 5 of 5' and 'Display 10 records per page'.

Admin Config

When editing a Command Center type page via LAB, in the Component list view, admins see a new Omni In-Progress Work component.

After dropping the component onto the page, on the right hand side, the admin needs to configure what data should be shown on in the component:

[P0] Title

Admin can input a custom name for the card. By default, 'In-Progress Work' is used.

[P0] Columns

Admin can pick and choose which columns are shown.

Admin can choose the order in which columns are shown.

Columns shown by default:

- Type: Salesforce object type for the work, such as Lead, Case, and Chat, etc.
- Details: Information from the assigned compact layout for the object and record type, which provides more context about the work item.
- Sentiment: Real-time sentiment provided by the CSI team. Values can be Negative, Neutral, Positive, or Mixed.
 - [WIP] in #csi-real-time-insights-workgroup Slack Channel
- Owner: The name of the service rep or AI agent assigned to the work.
- Flag:
 - For human-owned work: Indicates whether a service rep or conversation intelligence rule raised a flag.
 - For AI-owned conversational: Indicates whether the AI agent raised a flag to get help from a supervisor. The Raise Flag for Supervisor Agentforce action triggers the flag.
 - On click, the supervisor can see
 - latest whisper message
 - the option to lower the flag.
- Action: “Monitor” opens a conversation transcript window for messaging & voice conversations, and case page for case work.
 - For AI conversations, supervisors can transfer the work to a rep or lower the flag.
- Routed By: how work was funneled to the assigned owner
 - If work was routed using queue based routing the related cell shows [queue icon] + the Omni-Channel-enabled queue used to route the work to the service rep. Ex: [queue icon] “Billing”
 - If work was routed using skills based routing the related cell shows [skills icon] + the skill(s) assigned to the work item. Ex: [skills icon] “Billing, English”
 - If work was routed using Direct-to-Agent routing the related cell shows [D2A icon] + “Direct to Agent”
- Requested Time: Datetime the item was assigned to the queue.
- Assigned Time: Datetime when Omni-Channel pushed and assigned the item into the service rep’s Omni-Channel component.
- Accepted Time: Datetime when work item was accepted
- Handle Time: Amount of time the item has been open with the service rep. It’s calculated using the difference between “now” and when the service rep accepted the work.
- Speed to Answer: How quickly the service rep opened the assigned item. It’s calculated as the amount of time between when the work was requested and when the service rep accepted it.
 - This value is BLANK for AI agent-owned work.

Column available to be added:

- INTR: A Boolean showing whether the work is interruptible or not. A checkmark indicates interruptible work.
- [SALES CLOUD-SPECIFIC COLUMNS]:

 Sales & Marketing Columns in Omni In-Progress Work Component

[P0] Actions

Admin can pick and choose which actions should be shown on the component.

- The actions available for the In-Progress components are all Screenflows in the org.
- We provide one [OOTB actions](#) for the In-Progress work view today: AWS Dashboard
- This config currently lives in the supervisor config on page level but will need to move to component level.

Supervisor Experience

After admin config, Supervisors can see the In-Progress component within their command center page. Supervisors can then customize their view further:

Filters

Options visible to supervisors in filtering of Queue, Skill, and Service Rep are driven by the selections in their Supervisor Config.

By default, if no filter is applied, the list view shows work items from all queues, skills, and service reps that are selected within the supervisor config.

[P2] Column Filter

The supervisor can search and select all, one, or multiple options (same UI experience as today; visual shown below) in any of the following columns:

- Queue
- Skill
- Channel
- Owner
- Sentiment

Filters on Multiple Columns

Applying filters on multiple columns filters the results further in order of filters applied.

Example:

1. Supervisor filtered to show only work in X and Y queues

2. The work list shows only in-progress work items from X and Y queues.
3. Supervisor applied filter to show work with Negative sentiment
4. The work list shows only in-progress work items from X and Y queues that currently have Negative sentiment.

Applied-Filter(s) Visibility

Column filter button indicates when a filter has applied to the column (blue arrow in screenshot below).

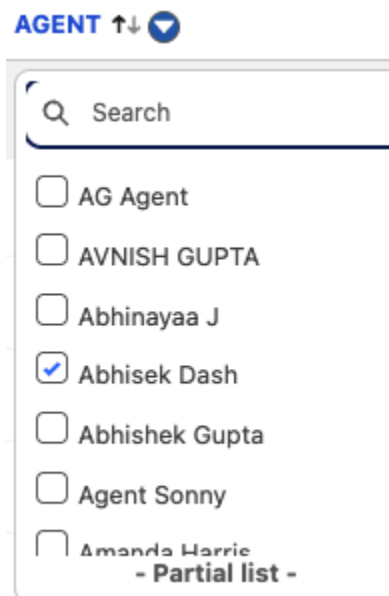

Bound-Exceeding Filter Option List

If the results list is longer than the number of results shown to the user, a “Partial list” label is displayed (as shown below).

- Supervisor can still search and receive results for filter options beyond the initially loaded list.

Filter Persist

Column filters are bound by the user session (front-end filter).

[P0] Multi-Select Filter

Supervisor can filter their view using a backend filter to refine the following factors that drive what work is shown in the list view

- Queue
- Skill (includes radio button selecting ‘One or more selected skills’ or ‘All selected skills’)

- Channel
- [264] Team: Public Groups selected in the Supervisor Config's 'Select Visible Agents' section
- Owner
- Sentiment
- Human & AI Work: Choose to show all (default), only-human-owned, or only-AI-owned work

Applied-Filter(s) Visibility

Supervisor can see what filters they have applied to their view via “pills” above the list view such as: (Queue: Billing +1 more) (Sentiment: Positive)

Filter Clear

The supervisor can clear the applied filter(s) by navigating to the backend filter button and deleting the applied filter(s).

Filter Persist

Filters applied via this backend filter are saved until reset by the user. The lack of sticky filters is a long standing customer pain point with the current experience.

[264 stretch] Savable Filters

Supervisors can save applied filters (same concept as record list view “Save as” filter option).

[P0] Sort

Supervisors can sort their list view via the following columns:

- Requested Time
- Assigned Time
- Accepted Time
- Handle Time
- Speed to Answer

[P0] Actions

Work Selection

- Using checkboxes, Supervisors can select one or more work items to trigger actions on.
- All work items can be selected using the top most checkbox in the column label row.

This is possible today but we have a bug on the select-all experience which we need to resolve in this component as it is a frustrating customer pain point today, requiring supervisors to select every work item if select-all behavior is desired.

Custom Actions

It is possible for admins to add custom Screen Flow [actions that are not applicable to the selected records](#) - this should throw the same error we throw today.

[P0] Clearing Supervisor Selections

Supervisors must be able to clear their selections to reset the list view back to the admin's configuration.

[P2] Search

Supervisors can use the search box to search for work items via the Details column.

[P2] Column Customization

Supervisors can reorganize the order in which their columns appear.

Supervisors can select columns to hide.

[264] Unified Backlog Component

[264] Unified Backlog Component

The Unified Backlog component shows supervisors a list view of all work (skills AND queues-based routing) that is pending service rep assignment. This information gives supervisors an idea of how efficiently work is moving through the backlog and helps them determine which queues are doing well and which could use a few more service reps.

*List of work should respect any Sharing Rules configured and filter out work that has any non-accessible fields to the user.

Backlog Summary

Work items yet to be picked up by agents and service reps

Admin Config

When editing a Command Center type page via LAB, in the Component list view, admins see a new Omni Backlog component.

After dropping the component onto the page, on the right hand side, the admin needs to configure what data should be shown on in the component:

[P0] Title

Admin can input a custom name for the card. By default, 'Backlog' is used.

[P0] Columns

Admin can pick and choose which columns are shown.

Admin can choose the order in which columns are shown.

Columns shown by default:

- Type: Salesforce object type for the work, such as Lead, Case, and Chat, etc.
- Details: Information from the assigned compact layout for the object and record type, which provides more context about the work item.
- Sentiment: Real-time sentiment provided by the CSI team. Values can be Negative, Neutral, Positive, or Mixed.
 - Sentiment is only populated if the conversation is coming from a transfer.
 - If the conversation is brand new, 'N/A' is shown for Sentiment value.
- INTR: A Boolean showing whether the work is interruptible or not. A checkmark indicates interruptible work.
- Route By: how work is categorized and funneled to the best available representative.
 - If work was routed using queue based routing the related cell shows [queue icon] + the Omni-Channel-enabled queue used to route the work to the service rep. Ex: [queue icon] "Billing"
 - If work was routed using skills based routing the related cell shows [skills icon] + the skill(s) assigned to the work item. Ex: [skills icon] "Billing, English"
 - If work was routed using Direct-to-Agent routing the related cell shows [D2A icon] + Service Resource's name. Ex: [D2A icon] "Sasha Golubova"
- Queue Position: The work item's position in the queue. Blank for skills-based routed work.
- Priority: The priority of the work item.
- Work Size: The size of the Omni-Channel work item based on the associated routing configuration.
- Wait Time: The amount of time that the work item has been pending.
- Requested Time: The date and time when the work item entered the backlog.
- Accept By: Work acceptance due date & time.
- Scheduled For: [add after 262 release]

Column available to be added:

- INTR: A Boolean showing whether the work is interruptible or not. A checkmark indicates interruptible work.
- Queue Priority: The QBR work's related queue's priority based on its routing configuration.

[P0] Actions

Admin can pick and choose which actions should be shown on the component.

- The actions available for the Backlog components are all Screenflows in the org.
- We provide one [OOTB actions](#) for the Backlog work view today: Assign Service Reps

- This config currently lives in the supervisor config on page level but will need to move to component level.

Supervisor Experience

After admin config, Supervisors can see the Backlog component within their command center page. Supervisors can then customize their view further:

Filters

Options visible to supervisors in filtering of Queue, Skill, and Service Rep are driven by the selections in their Supervisor Config.

By default, if no filter is applied, the list view shows work items from all queues, skills, and service reps that are selected within the supervisor config.

[P0] Multi-Select Filter

Supervisor can filter their view using a backend filter to refine the following factors that drive what work is shown in the list view

- Type
- Queue
- Skill (includes radio button selecting 'One or more selected skills' or 'All selected skills')
- Sentiment
- Human & AI Work: Choose to show all (default), only-human-owned, or only-AI-owned work
- Work Size

Applied-Filter(s) Visibility

Supervisor can see what filters they have applied to their view via “pills” above the list view such as: (Queue: Billing +1 more) (Sentiment: Positive)

Filter Clear

The supervisor can clear the applied filter(s) by navigating to the backend filter button and deleting the applied filter(s).

Filter Persist

Filters applied via this backend filter are saved until reset by the user. The lack of sticky filters is a long standing customer pain point with the current experience.

[264 stretch] Savable Filters

Supervisors can save applied filters (same concept as record list view “Save as” filter option).

[P0] Sort

Supervisors can sort their list view via the following columns:

- Position: The work item’s position in a queue.
- Wait time: Amount of time that the work item is waiting for a service rep.
- Requested Time: Datetime the item was assigned to the queue.
- Accept By: date & time by which the work item must be accepted
- Sentiment
- Queue Priority

[P0] Actions

Work Selection

- Using checkboxes, Supervisors can select one or more work items to trigger actions on.
- All work items can be selected using the top most checkbox in the column label row.

This is possible today but we have a bug on the select-all experience which we need to resolve in this component as it is a frustrating customer pain point today, requiring supervisors to select every work item if select-all behavior is desired.

Custom Actions

It is possible for admins to add custom Screen Flow [actions that are not applicable to the selected records](#) - this should throw the same error we throw today.

[P0] Clearing Supervisor Selections

Supervisors must be able to clear their selections to reset the list view back to the admin’s configuration.

[P2] Search

Supervisors can use the search box to search for work items via the Details column.

[P2] Column Customization

Supervisors can reorganize the order in which their columns appear.

Supervisors can select columns to hide.

[264] Service Reps Component

[264] Service Reps Component

The Service Reps component allows supervisors to keep up with their reps' presence statuses, channels, assigned queues, and open capacity. Supervisors can monitor how long their reps have been logged in and when they last accepted new work.

Admin Config

When editing a Command Center type page via LAB, in the Component list view, admins see a new Omni Service Reps component.

After dropping the component onto the page, on the right hand side, the admin needs to configure what data should be shown on in the component:

[P0] Title

Admin can input a custom name for the card. By default, 'Service Reps' is used.

[P0] Columns

Admin can pick and choose which columns are shown.

Admin can choose the order in which columns are shown.

Columns shown by default:

- Rep: Profile picture + the first and last name of the service rep.
- Status: The service rep's current presence status, as set in the Omni-Channel component.
- Flag: Indicates whether a service rep or conversation intelligence rule raised a flag.
- Action: Allows supervisor to change a service rep's status.
 - "Change Status" option is visible for logged-in reps. On click, the supervisor can select a different presence status to move the rep to. The change is applied in real-time.
- Work Summary: a string listing the number of work items of each type currently assigned or open with the service rep.
 - Assigned work items are in the service rep's component and waiting for acknowledgment.
 - Open work items have been accepted and the work is in the service rep's inbox.
- State: Amount of time the service rep has been in the current presence status.

- Login: Amount of time the service rep has been logged into an online or busy Omni-Channel status. This field reflects the duration of the service rep's entire Omni-Channel session, which ends when the service rep goes offline in Omni-Channel or closes their browser.
- Accept: Amount of time since the service rep last accepted a work item, either explicitly or through auto-accept.
- Primary Capacity: The percentage of the service rep's total capacity for uninterruptible work that's being used. (When service rep capacity reaches 99.1%, the service rep is shown as 100%).
 - 0–49% capacity is shown with a green icon
 - 50–79% capacity is shown with a yellow icon
 - 80–100% capacity is shown with a red icon
- Interruptible Capacity: The percentage of the service rep's total capacity for interruptible work that's being used. (When service rep capacity reaches 99.1%, the rep is shown as 100%).
 - 0–49% capacity is shown with a green icon
 - 50–79% capacity is shown with a yellow icon
 - 80–100% capacity is shown with a red icon
- ACW: Short for After Conversation Work. Amount of time the service rep spent on closing tasks after a conversation.
- Workload: The total size of the service rep's assigned and open work that uses primary capacity compared to the service rep's capacity set in the presence configuration. The work size is based on the routing configuration when the work is assigned.
- Channels: The service rep's associated Service Channels (for service reps in an online status), so you know what types of work the available service rep can handle.
- Queues: Omni-Channel-enabled Salesforce queues that the service rep can receive work through in Omni-Channel.
 - Shown only in orgs that use Omni-Channel queues-based routing.
- Skills: Skills that are assigned to the service rep.
 - The Skills column is shown only in orgs that use Omni-Channel skills-based routing.

Accordion experience on each Service Rep row: With accordion expansion, the following information is shown for each Omni-Channel work item currently assigned or open with the service rep:

- Flag: Indicates if the service rep has a flag raised for the specific work item. On click, the supervisor can see
 - latest whisper message
 - the option to lower the flag.

- Monitor button (applicable to messaging & voice work items only): opens a conversation window showing the live conversation transcript.
- Details: Information from the assigned compact layout for the object and record type, which provides more context about the work item.
- Channel: Salesforce object type for the work, such as Lead, Case, or SOS.
- Queue: The Omni-Channel-enabled queue used to assign and route the work to the service rep.
- Skills: The list of skills applied to the work item.
- Work Size: The size of the Omni-Channel work item based on the routing configuration associated with the queue.
- ~~Status: Omni-Channel work status. It includes:~~
 - ~~Assigned work items in the service rep's Omni-Channel component waiting for acknowledgment.~~
 - ~~Open work items that are assigned to a service rep and are in the service rep's inbox.~~
- Sentiment?

[P0] Actions

Admin can pick and choose which actions should be shown on the component.

- The actions available for the Backlog components are all Screenflows in the org.
- We provide two [OOTB actions](#) for the Backlog work view today:
 - Change Queues
 - Change Skills
- This config currently lives in the supervisor config on page level but will need to move to component level.

Supervisor Experience

After admin config, Supervisors can see the Service Reps component within their command center page. Supervisors can then customize their view further:

Filters

Options visible to supervisors in filtering of Queue, Skill, and Service Rep are driven by the selections in their Supervisor Config.

By default, if no filter is applied, the list view shows Service reps within the Public Groups selected in the “Select Visible Agents” selection of the related Supervisor Config.

[P0] Multi-Select Filter

Supervisor can filter their view using a backend filter to refine the following factors that drive what work is shown in the list view

- Rep
- Status
- Flag
- Type
- Queue
- Skill (includes radio button selecting 'One or more selected skills' or 'All selected skills')
- Sentiment
- Human & AI Work: Choose to show all (default), only-human-owned, or only-AI-owned work
- Team

Applied-Filter(s) Visibility

Supervisor can see what filters they have applied to their view via “pills” above the list view such as: (Team: EU) (Queue: Billing +1 more)

Filter Clear

The supervisor can clear the applied filter(s) by navigating to the backend filter button and deleting the applied filter(s).

Filter Persist

Filters applied via this backend filter are saved until reset by the user. The lack of sticky filters is a long standing customer pain point with the current experience.

[264 stretch] Savable Filters

Supervisors can save applied filters (same concept as record list view “Save as” filter option).

[P0] Sort

Supervisors can sort their list view via the following columns:

- Rep: alphabetical
- Status: in the following order
 - Online statuses in alphabetical order
 - Busy statuses in alphabetical order
 - Offline
- State

- Login
- Accept
- Primary Capacity
- Interruptible Capacity
- Workload

[P0] Actions

Work Selection

- Using checkboxes, Supervisors can select one or more Service Reps to trigger actions on.
- All Service Reps can be selected using the top most checkbox in the column label row.

This is possible today but we have a bug on the select-all experience which we need to resolve in this component as it is a frustrating customer pain point today, requiring supervisors to select every work item if select-all behavior is desired.

Custom Actions

It is possible for admins to add custom Screen Flow [actions that are not applicable to the selected records](#) - this should throw the same error we throw today.

[P0] Clearing Supervisor Selections

Supervisors must be able to clear their selections to reset the list view back to the admin's configuration.

[P2] Column Customization

Supervisors can reorganize the order in which their columns appear.

Supervisors can select columns to hide.

[264] Improved Setup

[264] Improved Setup

Pain Point

In 262, admins can edit or clone the OOTB Command Center for Service flexipage/template. After editing the OOTB page, there is no way to get back to the original template. This creates two pain points:

- Customers no longer have the OOTB page to use as a starting point for a new Command Center for Service page. They must instead either start from scratch or clone their own pages.
- Most importantly, **we no longer have a template to populate with new components** as we cannot overwrite customer-edited pages. This means admins must know about the new components from release notes = poor discoverability.

Solution

An improved setup experience that allows admins to easily generate fresh instances of the [Command Center for Service OOTB flexipage](#).

User Flow	Acceptance Criteria
Admin navigates to the <i>Supervisor Settings</i> page in Setup.	n/a
Admin can see a new "Generate New Command Center" button.	A dedicated section in Supervisor Settings must feature a "Generate New Command Center" primary action button.
On click, the "Command Center for Service" flexipage is cloned and admin is taken directly into the Lightning App Builder page editing view where they can see the "Command Center for Service" flexipage pre-populated with WEM, TabNext, and omni, components.	• Clicking the button must trigger a clone of the master OOTB FlexiPage template, creating a unique instance in the customer org. • Upon successful generation, the user must be automatically redirected to LAB with the new page loaded in the editing view. • Admins must be able to generate multiple versions over time; generating

	a new version must not overwrite or delete previously generated pages.
Admin must complete all the regular page setup steps such as naming, assigning page to Public Groups, and selection of app(s) in which the new page should be displayed.	

Roadmap

"Generate New Command Center" button leads admins through a set of questions which inform which components should be added to the newly generated template page before taking the admin into the LAB.

[264] Teams Filter (Collab with Field Service)

[264] Teams Filter

Pain Point

Today, there is no way to define and filter by Rep Teams. This means supervisors cannot

- Simply switch their view from Team A to Team B to see reps within their team context
- Easily compare performance between teams
- Easily report on teams

Currently, supervisors must manually search for and select each individual rep in a team to filter their view. To switch teams, they have to clear those selections and repeat the "one-by-one" selection process for the next group. This is inefficient, prone to error, and a top-tier frustration for users.

This is one of the most common customer complaints raised in nearly every supervisor-focused customer meeting:

- [VOC0 \(20 Accounts Impacted\): Save filters or views within OMNI Supervisor based on hierarchy or user fields](#)
- [VOC1: Teamleads can not report on their team in Omnichannel](#)
- [VOC2: define a hierarchical organisation with agents and their supervisors so supervisors only sees the agents they manage](#)
- [VOC3: Group Agents to a Team. Move Agents between teams](#)
- [VOC4: Omni Supervisor agent's Filter by Manager](#)
- [510 IdeaExchange points](#)
- [250 IdeaExchange points](#)

Example

Setup > Supervisor Config defines what information each supervisor should see. If Shilpa the supervisor is responsible for the Oregon team & Sasha the supervisor is responsible for the San Francisco team, Shilpa's Supervisor Config will have the Oregon team selected and Sasha's Supervisor Config will have the SF team selected.

However, it is very common for customers to give supervisors access to multiple teams so that supervisors can easily cover each other in absence cases. This means Shilpa & Sasha will both have the Oregon and SF teams selected. They now have to manually pick and choose their members to filter their view rather than being able to quickly select to only see their respective team until need to absence coverage comes up.

Solution

Maintained connection between Service Territories and Public Groups:

- Creating a Service Territory results in an automatic creation of a Public Group with the same name (existing experience)
- Adding a Service Territory member (Service Resource) automatically adds the user to the Public Group (today, user must create a User Territory to add a member to the Public Group; adding them as a Service Territory member does not automatically add them to the Public Group)
- Supervisors must be able to move Service Resources between Service Territories (with [perm requirements](#)). Such updates result in synchronized Public Group member updates.
- Service Resources can be members of **multiple** Service Territories (possible only with User Territories today, not Territory Members)
- Service Supervisors must have access to this functionality **without** a Field Service license. This means Service Cloud licenses should include the Service Resource & Service Territory objects.

Expected User Experience

1. Admin creates teams using Service Territories such as 'Oregon team' and 'SF team'.
2. Admin adds Service Resources A,B,C as Service Territory members to the 'Oregon team' and Service Resources X,Y,Z as Service Territory members to the 'SF team'.
3. Within Setup > Public Groups, admin sees two automatically created Public Groups labeled 'Oregon team' and 'SF team'.
 - a. Both Public Groups have 3 members: A,B,C users in 'Oregon team' and X,Y,Z users in 'SF team'.
4. Within Setup > Supervisor Config > Select Visible Agents, admin selects 'Oregon team' and 'SF team' Public Groups.
5. Within Service Console > Command Center for Service, supervisor sees 6 users: A,B,C,X,Y,Z
6. Supervisor can apply a "Team" filter to select from the Public Groups selected within their Supervisor Config ('Oregon team' and 'SF team'). Selecting 'Oregon team' within the filter filters the supervisor view to only show A,B,C Service Resources.

Migration & Deprecation

Migration & Deprecation

June 2026 (262 Patch) Behavior

After the June patch release, customers will be able to create a limited modular supervisor experience using 2 omni supervisor components - wallboard metric card & In-Progress Work - and WEM components. To see other supervisor information (Service Rep & Backlogs), **supervisors will need to navigate to the existing Command Center for Service.**

Existing Command Center for Service

No change.

Modular Command Center for Service

Admins can make use for the modular supervisor experience by:

1. Admins will see a Command Center for Service flexipage in Lightning App Builder. This flexipage will have tabs populated with WEM and supervisor Wallboard & In-Progress Work components.
2. Admins will clone the flexipage & edit their version in LAB.
3. Admins will assign the page to a Public Group applicable to supervisors.
4. Admins will make the modular Command Center for Service available for their app of choice (Service Console).
5. Supervisors can see WEM, wallboard metrics, and In-Progress work components in the new Modular Command Center for Service navigation option within the Service Console app.

Sept 2026 (264) Behavior

After the 264 release, all supervisor components will be available within the Lightning App Builder for the Command Center page type. Specifically, in 264, we will deliver the Unified Backlog & Service Rep components. **How customers make use of these 264 components will depend on if they adopted the June components.**

Existing Command Center for Service

1. Supervisors will see a banner telling them to inquire with their admin about a modular/customizable supervisor experience.

Modular Command Center for Service for those who adopted in June

- Admins will need to edit their existing modular Command Center for Service to add the 264 components.
- Admins can also generate & customize a new “Command Center for Service” template populated with 262 & 264 components via the [new improved setup](#).

Modular Command Center for Service for NEW adopters

Admins can make use for the modular supervisor experience by:

1. Admins will see a Command Center for Service flexipage in Lightning App Builder. This flexipage will have tabs populated with WEM & **all** supervisor components.
2. Admins will clone the flexipage & edit in LAB.
3. Admins will assign the page to a Public Group applicable to supervisors.
4. Admins will make the modular Command Center for Service available for their app of choice (Service Console).
5. Supervisors can see WEM, wallboard metrics, and In-Progress work components in the new Modular Command Center for Service navigation option within the Service Console app.

Change Management Enablement

To ensure a seamless transition to the new Modular Command Center for Service, customer support will be essential in helping users navigate the phased rollout between June and September 2026.

Because the initial June release offers a "limited" experience requiring supervisors to toggle between the new modular components and the existing Command Center for full visibility, we will need to provide clear documentation for the upcoming release of final components.

As we move into the September (264) release, support will be critical in guiding existing modular adopters through the manual update of their custom pages to include the new Unified Backlog and Service Rep components.

- Release Notes & Help Docs:
 - 262 patch:
 - Wallboard Metric Cards
 - In-Progress Work Component
 - OOTB flexipage
 - 264:
 - Backlog component
 - Service Rep list view component

- Update to flexipage
- SE enablement sessions
- Customer facing demos

Omni Supervisor Depreciation Timeline

TBD. 268?
